

Data used in Examples

Exponential Data

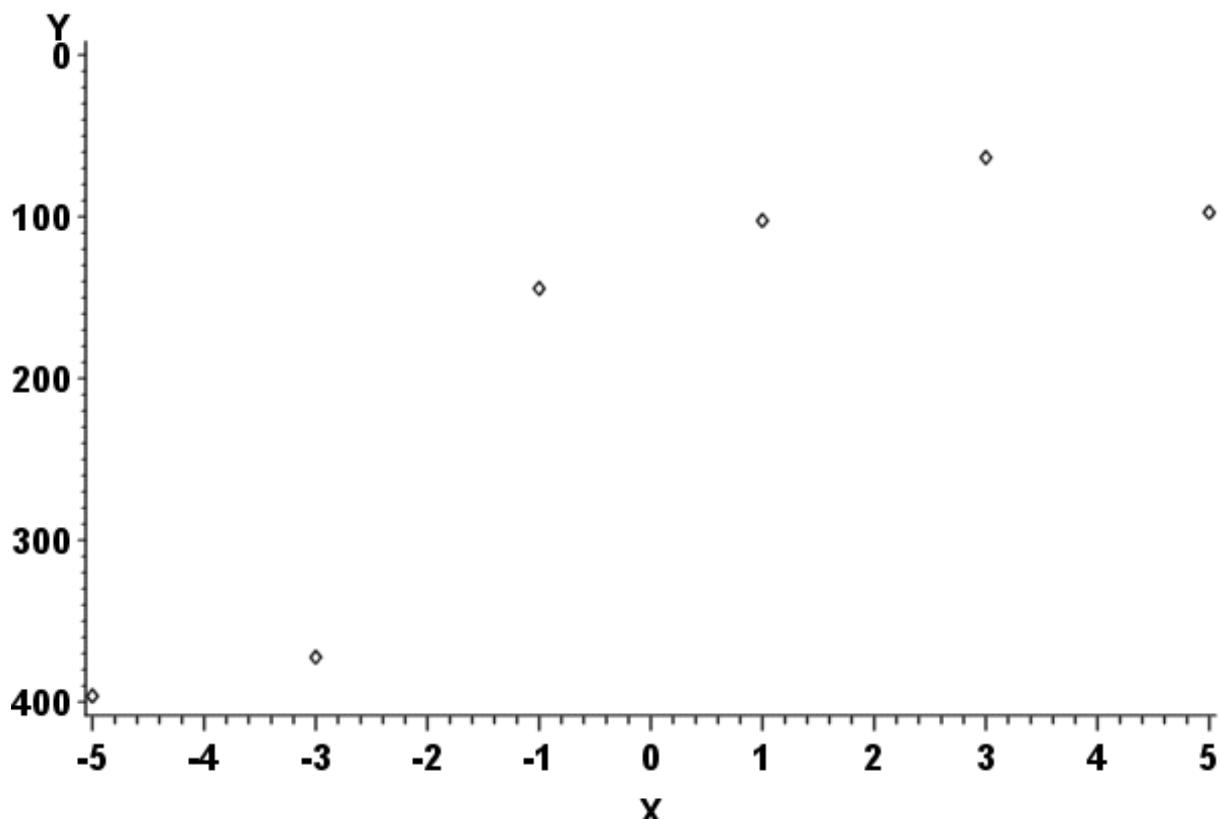

This is just a "made up" data set to illustrate a simple exponential model.

1) Y - Dependent variable

2) X - Independent variable (regressor)

```
data exp;  
    input x y;  
  
    cards;  
    -5    -396.2983  
    -3    -372.2983  
    -1    -144.2983  
    1     -102.2983  
    3     - 63.2983  
    5     - 97.2983  
    ;
```

Exponential Data

Prickly Lettuce Germination Study

This data records the change in cumulative germination over time for two bio-types of prickly lettuce. The bio-types are lines which are susceptible or resistant to sulfonylurea herbicides. Three temperature regimes are also used, however, only the 8 C data is used here.

1) REP - Replication

2) BIO - Biotype classification

3) TEMP - Germination temperature (C)

4) TIME - Time after start (hrs)

5) GERM - Cumulative percent germination
