

Rectangle sampling activity

HON Stat 251

Consultation questions

If you can bring any or all of the information from #1-9 to the meeting, that really helps get a feel for what you're doing. If you can't bring all of that, just try to address them in some way at the meeting.

1. What is your overall research question(s) you are trying to answer from the data?
2. What are the elements (sampling units) that you used? Give brief description of them.
3. How were the units chosen? What is the sampling frame used to choose the units?
4. How were the units placed within the sampling or experimental design?
5. If it is an experiment, how many different factors were used and how many levels of each were there?
6. How were the factors allocated among the units (similar to #4)? Are the factor levels fixed or random?
7. If you can, a rough sketch or drawing of the design might help a lot.
8. What is your timeline for this looking like? Are answers needed sooner rather than later?
9. Is there literature about your study that is available?
